

LCD Televisions

LCD TV's have stamped their authority on the High Definition television market. LCD has been around in computer monitors, video cameras etc for a long time and finally the technology has been perfected for larger screens with up to a 65 inch version now available.

Some of the benefits include long life span (more than twice the life span of Plasmas), large viewing angle, no burn in, low power consumption and extremely light weight, with the added benefit of thin good looks. They are sure to be in most peoples home in the near future.

LCD's are now dominating the world of 1080p High Definition LCD T.V's. and for a great high definition picture it is almost impossible to go past an LCD T.V.

In the commercial public display end of the market, LCD displays feature strongly as they have many advantages over plasma. These advantages are superior image quality on data, no static screen image burn-in factors to consider, and generally double the life span of plasma. Both technologies are fantastic in their own right, with the purchasing choice coming down to the application.
