

DVD/VCR

There are many brands of DVD players on the market and it can seem quite confusing but there are differences and just like in life you get what you pay for. With plasma, projectors and LCD T.V's it is essential to buy the correct product

The difference between a good quality DVD player and a cheap nasty DVD player can be seen in two ways the first is the audio. the audio quality of a good quality DVD player, especially in surround sound, is extremely important as poor audio can destroy the cinematic experience. the new range of high definition T.V's requires a much higher picture quality than ever demanded before, this is why Mac Smart Home Centre offers DVD players with high definition up scaling as well as HDMI outputs. Buying a Cheap DVD player can be like buying a Ferrari with mini minor tires it will not perform to the best of its ability the same goes here, the cabling used from the DVD player can also perform a vital role.
